AVERTAGES AND COMPACT, ABSOLUTELY SUMMING AND NUCLEAR OPERATORS ON $C(\Omega)$

Dumitru Popa

Abstract. In the paper we introduce averages of each type and use these averages to construct examples of weakly compact operators on the space $C(\Omega)$ for which the necessary and sufficient conditions that they be compact, absolutely summing or nuclear are distinct. A great number of concrete examples, in various situations, are given.

1. Introduction

Let $\Omega$ be a compact Hausdorff space, $\Sigma$ the $\sigma$-field of Borel subsets of $\Omega$, $C(\Omega)$ the space of all scalar-valued continuous functions on $\Omega$ under the uniform norm, $X$ a Banach space and $U : C(\Omega) \to X$ a bounded linear operator. It is well-known, see [3, Chapter VI], that $U$ has a representing vector measure $G$, and that $U$ is weakly compact if and only if $G$ takes its values in $X$; $U$ is compact if and only if $G$ has norm compact range; $U$ is absolutely summing if and only if $G$ has bounded variation; $U$ is nuclear if and only if $G$ has a Bochner integrable Radon-Nikodym derivative with respect to its variation $|G|$.

In [8] are given explicit examples of bounded linear operators on $C[0,1]$ with values in $c_0$ which distinguish certain ideals of operators. In this paper we complete the results and examples in [8] by giving many other examples.

We fix now some notations and terminology. Let $X$ be a Banach space, $\Sigma$ a $\sigma$-field of sets and $G : \Sigma \to X$ a vector measure. We denote by $|G|$ the variation measure of $G$, $\|G\|$ the semivariation, $\|G\|(E) = \sup_{\|x^*\| \leq 1} |x^*G|(E)$, $E \in \Sigma$, see [3, Chapter I, pp. 3–4]. If $(S, \Sigma, \mu)$ is a finite measure space, $X$ a Banach space and $f : S \to X$ a $\mu$-Bochner integrable function we write $\int_S f d\mu$ for the Bochner integral; if $f : S \to X$ is a $\mu$-Pettis integrable function, the Pettis norm of $f$ is defined by $\|f\|_{\text{Pettis}} = \sup_{\|x^*\| \leq 1} \int_S |x^*f| d\mu$, see [3, Chapter II].

If $(X_n)_{n \in \mathbb{N}}$ is a sequence of Banach spaces, we denote $c_0(X_n \mid n \in \mathbb{N})$, the Banach space of all sequences $(x_n)_{n \in \mathbb{N}}$, $x_n \in X_n$ for every $n \in \mathbb{N}$, $\|x_n\| \to 0$, endowed to the norm $\|(x_n)_{n \in \mathbb{N}}\| = \sup_{n \in \mathbb{N}} \|x_n\|$ and similarly, $l_\infty(X_n \mid n \in \mathbb{N})$.
denote the Banach space of all sequences \((x_n)_{n \in \mathbb{N}}\), \(x_n \in X_n\) for every \(n \in \mathbb{N}\), with \(\sup_{n \in \mathbb{N}} \|x_n\| < \infty\), endowed to the norm \(\|\{(x_n)_{n \in \mathbb{N}}\} = \sup_{n \in \mathbb{N}} \|x_n\|\).

When \(X_n = X\), we write \(c_0 (X)\) resp. \(l_\infty (X)\). By \(l^n_\infty (X)\) we denote
\[
(X \times \cdots \times X)_{n \text{ times}}.
\]

The scalar field \(\mathbb{R}\) (or \(\mathbb{C}\)) is denoted \(\mathbb{K}\) and if \(n \in \mathbb{N}\), \(1 \leq p \leq \infty\), then
\[
l^n_p = \left(\mathbb{K}^n, \| \cdot \|_p \right),
\]
where \(\|(\alpha_1, \ldots, \alpha_n)\|_p = (\sum_{i=1}^n |\alpha_i|^p)^{\frac{1}{p}}\) if \(p < \infty\) and \(\|(\alpha_1, \ldots, \alpha_n)\|_\infty = \max_{1 \leq i \leq n} |\alpha_i|\). Further \(p^*\) is the conjugate of \(p\) and by \((e_n)_{1 \leq i \leq n}\) we denote the standard basis in \(l^n_p\).

If \((a_n)_{n \in \mathbb{N}}, (b_n)_{n \in \mathbb{N}}\) are two real sequences we write \(a_n \simeq b_n\) if and only if there exist \(m, M > 0\) such that \(mb_n \leq a_n \leq Mb_n\) for every \(n \in \mathbb{N}\). If \(k \in \mathbb{N}\) and \((a_{nk})_{n \in \mathbb{N}}, (b_{nk})_{n \in \mathbb{N}}\) are two real sequences we write \(a_{nk} \simeq b_{nk}\) if and only if there exist \(m_k, M_k > 0\) such that \(m_kb_{nk} \leq a_{nk} \leq M_kb_{nk}\) for every \(n \in \mathbb{N}\).

If \(X\) is a Banach space, \(1 \leq p < \infty, m \in \mathbb{N}\) and \(x_1, x_2, \ldots, x_m\) a finite system of vectors in \(X\), we write
\[
w_p (x_i \mid 1 \leq i \leq m; X) = \sup_{\|x\| \leq 1} (|x^* (x_1)|^p + \cdots + |x^* (x_m)|^p)^{\frac{1}{p}} = \|T : X^* \to l^n_p\|,
\]
where \(T (x^*) = (x^* (x_1), \ldots, x^* (x_m))\).

In the rest of the paper, \(\mathcal{B}\) denotes the \(\sigma\)-algebra of all Borel sets in \([0, 1]\), \(\lambda : \mathcal{B} \to [0, 1]\) the Lebesgue measure, \((\nu_n)_{n \in \mathbb{N}}\) the sequence of Rademacher functions and \(C [0, 1]\) the space of all scalar-valued continuous functions on \([0, 1]\) under the uniform norm. If \(X\) is a Banach space, \(L_1 (\lambda, X)\) is the space of \(\lambda\)-Bochner integrable functions. If \(\mu, \nu\) are two positive measures we denote \(\mu \otimes \nu\) their product.

All notation and terminology, not otherwise explained, are as in \([2, 3]\).

### 2. Scalar and vector averages

Let \(X\) be a Banach space, \(m \in \mathbb{N}\) and \(x_1, x_2, \ldots, x_m\) a finite system of vectors in \(X\). As in \([8]\) we define \(\text{Average} (x_i \mid 1 \leq i \leq m)\) as the finite system with \(2^m\) elements obtained by arranging in the lexicographical order of \(\{-1, 1\}^m\), the set of all the elements of the form \(\varepsilon_1 x_1 + \cdots + \varepsilon_m x_m\) for \((\varepsilon_1, \ldots, \varepsilon_m) \in \{-1, 1\}^m = D_m\) (On \(\{-1, 1\}\) we consider the natural order). We will consider \(\text{Average} (x_i \mid 1 \leq i \leq m)\) as an element of the space \(X^m\) and as sets we have the equality
\[
\text{Average} (x_i \mid 1 \leq i \leq m) = \{\varepsilon_1 x_1 + \cdots + \varepsilon_m x_m \mid (\varepsilon_1, \ldots, \varepsilon_m) \in D_m\}.
\]
The idea of considering these averages was suggested to the author by the well-known discrete form of Rademacher means, namely the equality
\[
\int_0^1 \|x_1 r_1(t) + \cdots + x_m r_m(t)\| \, dt = \frac{1}{2m} \sum_{(\varepsilon_1, \ldots, \varepsilon_m) \in D} \|\varepsilon_1 x_1 + \cdots + \varepsilon_m x_m\|
\]
see [1], [2]. Further, in [1, Exercise 8.18(a), p. 107], or [9, p. 64] appear also these averages.

**Lemma 1.** Let \( m \in \mathbb{N} \) and \( \alpha_1, \alpha_2, \ldots, \alpha_m \) be a finite system of scalars. Then
\[
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_\infty \asymp \|(\alpha_1, \ldots, \alpha_m)\|_1, \\
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_1 \asymp 2^m \|(\alpha_1, \ldots, \alpha_m)\|_2, \\
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_2 = \left(\sqrt{2}\right)^m \|(\alpha_1, \ldots, \alpha_m)\|_2.
\]

**Proof.** Indeed, in the real case, we have obvious
\[
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_\infty = \max_{(\varepsilon_1, \ldots, \varepsilon_m) \in D_m} |\varepsilon_1 \alpha_1 + \cdots + \varepsilon_m \alpha_m| = \sum_{i=1}^m |\alpha_i|
\]
and from here, taking the real and imaginary part, we deduce, in the complex case
\[
\frac{1}{2} \sum_{i=1}^m |\alpha_i| \leq \|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_\infty \leq \sum_{i=1}^m |\alpha_i|
\]
see also [1, Exercise 8.18(a), p. 107], or [9, p. 64].

For the second, by Khinchin’s inequality, see [1], [2], [5], we have
\[
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_1 = \sum_{\varepsilon \in D_m} |\varepsilon_1 \alpha_1 + \cdots + \varepsilon_m \alpha_m| \asymp 2^m \|(\alpha_1, \ldots, \alpha_m)\|_2.
\]

The last equality follows from the well-known equality
\[
\|\text{Average} (\alpha_i \mid 1 \leq i \leq m)\|_2 = \left(\sum_{\varepsilon \in D_m} |\varepsilon_1 \alpha_1 + \cdots + \varepsilon_m \alpha_m|^2\right)^{\frac{1}{2}} = \left(\sqrt{2}\right)^m \|(\alpha_1, \ldots, \alpha_m)\|_2.
\]

Our next definition is a natural iteration for averages.

**Definition 2.** For \( k \in \mathbb{N} \cup \{0\} \) define \( f_k : \mathbb{N} \to \mathbb{N} \) by
\[
\begin{cases}
   f_0 (n) = n, \\
   f_{k+1} (n) = 2f_k (n), \quad k \geq 0.
\end{cases}
\]

Let \( X \) be a Banach space, \( n \in \mathbb{N} \) and \( x_1, x_2, \ldots, x_n \) a finite system of vectors in \( X \). Define
\[
\text{Average}_1 (x_i \mid 1 \leq i \leq n; X) = \text{Average} (x_i \mid 1 \leq i \leq n; X).
\]
Let also \( k \in \mathbb{N} \). For the \( f_k(n) \) finite system
\[
\text{Average}_k (x_i \mid 1 \leq i \leq n; X) = \left\{ \beta_1, \ldots, \beta_{f_k(n)} \right\},
\]
say, we apply the same procedure and denote
\[
\text{Average}_{k+1} (x_i \mid 1 \leq i \leq n; X) = \text{Average} (\beta_i \mid 1 \leq i \leq f_k(n); X).
\]
We consider \( \text{Average}_k (x_i \mid 1 \leq i \leq n; X) \) as an element of the space \( X^{f_k(n)} \).

**Lemma 3.** Let \( n \in \mathbb{N}, \alpha_1, \alpha_2, \ldots, \alpha_n \) be a finite system of scalars and \( k \in \mathbb{N} \). Then
\[
\| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_\infty \leq \| (\alpha_1, \ldots, \alpha_n) \|_1,
\]
\[
\| \text{Average}_2 (\alpha_i \mid 1 \leq i \leq n) \|_\infty = 2^n \| (\alpha_1, \ldots, \alpha_n) \|_2,
\]
\[
\| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_\infty \leq f_k(n) \sqrt{f_2(n) f_3(n) \cdots f_{k-2}(n)} \| (\alpha_1, \ldots, \alpha_n) \|_2, \quad k \geq 3.
\]

**Proof.** With the same notations as in Definition 2, by Lemma 1 we have
\[
\| \text{Average}_{k+1} (\alpha_i \mid 1 \leq i \leq n) \|_\infty = \| \text{Average} (\beta_i \mid 1 \leq i \leq f_k(n)) \|_\infty
\]
\[
\geq \left\| \left( \beta_1, \ldots, \beta_{f_k(n)} \right) \right\|_1 = \| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_1,
\]
\[
\| \text{Average}_{k+1} (\alpha_i \mid 1 \leq i \leq n) \|_1 = \| \text{Average} (\beta_i \mid 1 \leq i \leq f_k(n)) \|_1
\]
\[
\geq 2^{f_k(n)} \left\| \left( \beta_1, \ldots, \beta_{f_k(n)} \right) \right\|_2 = f_k(n) \| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_2.
\]

Denote
\[
a_k = \| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_\infty,
\]
\[
b_k = \| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_1,
\]
\[
c_k = \| \text{Average}_k (\alpha_i \mid 1 \leq i \leq n) \|_2.
\]
Then from the above proved relations for each \( k \geq 1 \) we have
\[
a_{k+1} \geq b_k; \quad b_{k+1} \geq f_k(n) c_k; \quad c_{k+1} = c_k \sqrt{f_{k+1}(n)}.
\]

Because by Lemma 1
\[
c_1 = \| \text{Average} (\alpha_i \mid 1 \leq i \leq n) \|_2 = \sqrt{f_1(n) (\alpha_1, \ldots, \alpha_n) \|_2}
\]
we deduce
\[
c_k = \sqrt{f_1(n) f_2(n) \cdots f_k(n)} \| (\alpha_1, \ldots, \alpha_n) \|_2, \quad k \geq 1.
\]
From \( b_{k+1} \asymp f_{k+1} (n) c_k \) we get
\[
b_{k+1} \asymp f_{k+1} (n) \sqrt{f_1 (n) f_2 (n) \cdots f_k (n)} \| (\alpha_1, \ldots, \alpha_n) \|_2, \quad k \geq 1,
\]
i.e.,
\[
b_k \asymp f_k (n) \sqrt{f_1 (n) f_2 (n) \cdots f_{k-1} (n)} \| (\alpha_1, \ldots, \alpha_n) \|_2, \quad k \geq 2,
\]
and by Lemma 1
\[
b_1 = \| \text{Average} (\alpha_i \mid 1 \leq i \leq n) \|_1 \asymp 2^n \| (\alpha_1, \ldots, \alpha_n) \|_2.
\]
From \( a_{k+1} \asymp b_k, \quad k \geq 1 \) we get
\[
a_{k+1} \asymp f_k (n) \sqrt{f_1 (n) f_2 (n) \cdots f_{k-1} (n)} \| (\alpha_1, \ldots, \alpha_n) \|_2, \quad k \geq 2,
\]
i.e., for \( k \geq 3 \) we get the evaluations from the statement.

Also by Lemma 1,
\[
a_2 \asymp b_1 = 2^n \| (\alpha_1, \ldots, \alpha_n) \|_2,
\]
\[
a_1 = \| \text{Average} (\alpha_i \mid 1 \leq i \leq n) \|_\infty \asymp \| (\alpha_1, \ldots, \alpha_n) \|_1.
\]

We state now a result which is a well-known consequence of the Hahn-Banach theorem.

**Result.** Let \( X \) be a Banach space. Then for each \( x \in X \) we have
\[
\| x \| = \sup_{\| x^* \| \leq 1} \| x^* (x) \|.
\]

**Lemma 4.** Let \( X \) be a Banach space, \( n \in \mathbb{N}, x_1, x_2, \ldots, x_n \) a finite system of vectors in \( X \) and \( k \in \mathbb{N} \). Then
\[
\| \text{Average} (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp w_1 (x_i \mid 1 \leq i \leq n; X),
\]
\[
\| \text{Average}_2 (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp 2^w_2 (x_i \mid 1 \leq i \leq n; X),
\]
\[
\| \text{Average}_k (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp f_{k-1} (n) \sqrt{f_1 (n) f_2 (n) \cdots f_{k-2} (n)} w_2 (x_i \mid 1 \leq i \leq n; X), \quad k \geq 3.
\]

**Proof.** We will use the notations from Definition 2. From Result we have
\[
\| \text{Average} (x_i \mid 1 \leq i \leq n; X) \|_\infty = \max_{\| x^* \| \leq 1} \| \varepsilon_1 x_1 + \varepsilon_2 x_2 + \cdots + \varepsilon_n x_n \|,
\]
\[
= \max_{\| x^* \| \leq 1} \sup_{\varepsilon \in D_n} \| \varepsilon_1 x^*_1 (x_1) + \varepsilon_2 x^*_2 (x_2) + \cdots + \varepsilon_n x^*_n (x_n) \|
\]
\[
= \sup_{\| x^* \| \leq 1} \max_{\varepsilon \in D_n} \| \varepsilon_1 x^*_1 (x_1) + \varepsilon_2 x^*_2 (x_2) + \cdots + \varepsilon_n x^*_n (x_n) \|
\]
\[
= \sup_{\| x^* \| \leq 1} \| \text{Average} (x^*_i (x_i) \mid 1 \leq i \leq n) \|_\infty.
\]

By Lemma 1, for each \( \| x^* \| \leq 1 \) we have
\[
\| \text{Average} (x^*_i (x_i) \mid 1 \leq i \leq n) \|_\infty \asymp \| (x^*_i (x_i) \mid 1 \leq i \leq n) \|_1.
\]
thus \[ \| \text{Average} (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp w_1 (x_i \mid 1 \leq i \leq n; X). \]

We prove now that for each \( k \geq 1, \)
\[
\| \text{Average}_{k+1} (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp \sup_{\| x^* \| \leq 1} \| \text{Average}_k (x^* (x_i) \mid 1 \leq i \leq n) \|_1.
\]

Indeed, by Lemma 1 and from what we have proved above we deduce
\[
\| \text{Average}_{k+1} (x_i \mid 1 \leq i \leq n; X) \|_\infty \\
= \| \text{Average} (\beta_i \mid 1 \leq i \leq f_k (n); X) \|_\infty \\
\asymp w_1 (\beta_i \mid 1 \leq i \leq f_k (n); X) \\
= \sup_{\| x^* \| \leq 1} \| (x^* (\beta_i) \mid 1 \leq i \leq f_k (n)) \|_1 \\
= \sup_{\| x^* \| \leq 1} \| \text{Average}_k (x^* (x_i) \mid 1 \leq i \leq n) \|_1.
\]

The Lemma 3, implies, for each \( k \geq 2 \) and each \( \| x^* \| \leq 1 \)
\[
\| \text{Average}_k (x^* (x_i) \mid 1 \leq i \leq n) \|_1 \\
\asymp f_k (n) \sqrt{f_1 (n) f_2 (n) \cdots f_{k-1} (n)} \| (x^* (x_1), \ldots, x^* (x_n)) \|_2.
\]

Hence for \( k \geq 2 \)
\[
\| \text{Average}_{k+1} (x_i \mid 1 \leq i \leq n; X) \|_\infty \\
\asymp f_k (n) \sqrt{f_1 (n) f_2 (n) \cdots f_{k-1} (n)} w_2 (x_i \mid 1 \leq i \leq n; X)
\]
i.e., for \( k \geq 3 \) we get the evaluations from the statement.

Also, from Lemma 1
\[
\| \text{Average}_2 (x_i \mid 1 \leq i \leq n; X) \|_\infty \asymp \sup_{\| x^* \| \leq 1} \| \text{Average} (x^* (x_i) \mid 1 \leq i \leq n) \|_1 \\
\asymp 2^n \sup_{\| x^* \| \leq 1} \| (x^* (x_i) \mid 1 \leq i \leq n) \|_2 \\
= 2^n w_2 (x_i \mid 1 \leq i \leq n; X). \quad \Box
\]

**Notation.** Let \( (X_n)_{n \in \mathbb{N}} \) be a sequence of Banach spaces, \((x_{ni})_{1 \leq i \leq n} \subset X_n\) for each \( n \in \mathbb{N}. \) For each \( n \in \mathbb{N}, \) \( \text{Average} (x_{ni} \mid 1 \leq i \leq n; X_n) \) is an element of the space \( X_n^{\mathbb{N}} \) and we consider the sequence

\[(*) \quad \text{Average} (x_{ni} \mid 1 \leq i \leq n; X_n) \) \( n \in \mathbb{N}. \]

From Lemma 4, the sequence (*) is an element of the space

\[(**+) \quad c_0 (X_1, X_1, \ldots, X_1, \ldots, X_n, \ldots) \]

(each \( X_n \) appears \( 2^n \) for each \( n \in \mathbb{N} \)) if and only if \( w_1 (x_{ni} \mid 1 \leq i \leq n; X_n) \to 0. \)

In order to avoid unpleasant writings, instead (**+) we write simply \( c_0 (X_n \mid n \in \mathbb{N}). \)
In the rest of the paper for a natural number $k \geq 2$ we denote

\[ b_{n2} = 2^n, \]

\[ b_{nk} = \frac{1}{f_k(n) - 1} \left( f_1(n) f_2(n) \cdots f_{k-2}(n) \right), \quad \text{if } k \geq 3. \]

Using the same convention as above, from Lemma 4, the sequence $(\text{Average}_k \left( x_i \mid 1 \leq i \leq n; X_n \right))_{n \in \mathbb{N}}$ is an element of the space $c_0 \left( X_n \mid n \in \mathbb{N} \right)$ if and only if $b_{nk} w_2 (x_i \mid 1 \leq i \leq n; X_n) \to 0$.

### 3. The main results

We begin with a well-known fact:

**Fact.** Let $(S, \Sigma, \mu)$ be a finite measure space, $X$, $Y$ Banach spaces, $g : S \to L(X, Y)$ a $\mu$-Bochner integrable function and $G : \Sigma \to L(X, Y)$,

\[ G(E) = \int_E g d\mu \quad \text{for } E \in \Sigma. \]

Then

\[ \| g \|_{\text{Pettis}} = \| G \| (T) = \sup_{\| x \| \leq 1, \| y^* \| \leq 1} \int_S |\langle g(s) x, y^* \rangle| d\mu(s). \]

This follows from the definition of semivariation and the Pettis norm and the fact that \( \{ x \otimes y^* \mid \| x \| \leq 1, \| y^* \| \leq 1 \} \) is norming for $L(X, Y)$.

**Proposition 5.** Let $\Omega$ be a compact Hausdorff space, $\mu$ a nonnegative finite regular Borel measure on $\Omega$, $(X_n)_{n \in \mathbb{N}}$, $(Y_n)_{n \in \mathbb{N}}$ two sequences of Banach spaces, $g_n : \Omega \to L(X_n, Y_n)$ $\mu$-Bochner integrable functions such that for each $E \in \Sigma_\Omega$

\[ \int_E g_n d\mu \to 0 \quad \text{in the operator norm.} \]

Let $U : C(\Omega) \to c_0 \left( L(X_n, Y_n) \mid n \in \mathbb{N} \right)$ be the operator defined by

\[ U(f) = \left( \int_\Omega f(\omega) g_n(\omega) d\mu(\omega) \right)_{n \in \mathbb{N}}. \]

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if \( \sup_{\| x \| \leq 1, \| y^* \| \leq 1} \int_\Omega |\langle g_n(\omega) x, y^* \rangle| d\mu(\omega) \to 0. \)

(iii) $U$ is absolutely summing if and only if $\int_\Omega \sup_{n \in \mathbb{N}} \| g_n(\omega) \| d\mu(\omega) < \infty.$

(iv) $U$ is nuclear if and only if $U$ is absolutely summing and \( \| g_n(\omega) \| \to 0 \) $\mu$-a.e..

**Proof.** Let $G_n : \Sigma_\Omega \to L(X_n, Y_n)$, $G_n(E) = \int_E g_n d\mu$ for $E \in \Sigma_\Omega$. The hypothesis and Nikodym’s boundedness theorem, see [3], gives us that the family...
is uniformly bounded, i.e., there exists $L > 0$ such that
\begin{equation}
\int_{\Omega} |\langle g_n (\omega) x, y^* \rangle| \, d\mu (\omega) = |\langle G_n x, y^* \rangle| (\Omega) \leq L, \forall \|x\| \leq 1, \|y^*\| \leq 1, \ n \in \mathbb{N}.
\end{equation}

From hypothesis we get $\int_{\Omega} f (\omega) g_n (\omega) \, d\mu (\omega) \to 0$ for each simple function $f$ and from this fact and (1) we deduce $\int_{\Omega} f (\omega) g_n (\omega) \, d\mu (\omega) \to 0$ for each $f \in B (\Sigma_{\Omega})$, so $U$ is well defined. The representing measure of $U$ is
\begin{equation}
G (E) = \left( \int_E g_n (\omega) \, d\mu (\omega) \right)_{n \in \mathbb{N}}, \ E \in \Sigma_{\Omega}
\end{equation}
which, by hypothesis, takes its values in $c_0 (L (X_n, Y_n) \mid n \in \mathbb{N})$ and thus, see [3, Chapter VI], $U$ is weakly compact.

By [3, Chapter VI], $U$ is compact if and only if the range of $G$ is relatively norm compact and this by Proposition 1(ii) in [8] is equivalent to $\|g_n\|_{Pettis} \to 0$, which by Fact gives (ii).

By [3, Chapter VI], $U$ is absolutely summing if and only if $G$ is of bounded variation, which by Proposition 1(iii) in [8] is equivalent to (iii).

By [3, Chapter VI], $U$ is nuclear if and only if $U$ is absolutely summing and $G$ has a $\mu$-Bochner integrable derivative, and this by Proposition 1(iv) in [8], is equivalent to (iv).

□

In view of Example 3 in [8] it is a natural question to apply average technique for a triangular matrix of functions. Since by Lemma 4 there is a delineation between averages of first order and averages of order greater or equal than two, we analyze these two situations.

**Proposition 6.** Let $\Omega$ be a compact Hausdorff space, $\mu$ a nonnegative finite regular Borel measure on $\Omega$, $(X_n)_{n \in \mathbb{N}}$ a sequence of Banach spaces and $(h_{ni})_{1 \leq i \leq n} \subset L_1 (\mu, X_n)$.

(a) Suppose that
\begin{equation}
w_1 \left( \int_E h_{ni} \, d\mu \mid 1 \leq i \leq n; X_n \right) \to 0 \ \text{for each} \ E \in \Sigma_{\Omega}.
\end{equation}

Let $U : C (\Omega) \to c_0 (X_n \mid n \in \mathbb{N})$ be the operator defined by
\begin{equation}
U (f) = \left( \text{Average} \left( \int_{\Omega} f (\omega) h_{ni} (\omega) \, d\mu (\omega) \mid 1 \leq i \leq n; X_n \right) \right)_{n \in \mathbb{N}}.
\end{equation}

Then
(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if
\begin{equation}
\sup_{|\varepsilon| \leq 1} \|h_{n1} \varepsilon_1 + \cdots + h_{nn} \varepsilon_n\|_{Pettis} \to 0.
\end{equation}
(iii) \( U \) is absolutely summing if and only if
\[
\int_{\Omega} \sup_{n \in \mathbb{N}} w_1(h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) d\mu(\omega) < \infty.
\]

(iv) \( U \) is nuclear if and only if \( U \) is absolutely summing and
\[
w_1(h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) \to 0 \text{ for } \mu\text{-a.e. } \omega \in \Omega.
\]

(b) Let \( k \geq 2 \) be a natural number. Suppose that
\[
b_{nk}w_2 \left( \int_{E} h_{ni} d\mu \mid 1 \leq i \leq n; X_n \right) \to 0 \quad \text{for each } E \in \Sigma_{\Omega}.
\]

Let \( U : C(\Omega) \to c_0(X_n \mid n \in \mathbb{N}) \) be the operator defined by
\[
U(f) = \left( \text{Average}_k \left( \int_{\Omega} f(\omega) h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) \right)_{n \in \mathbb{N}}.
\]

Then
(i) \( U \) is weakly compact.
(ii) \( U \) is compact if and only if
\[
b_{nk} \sup_{\|f\|_2 \leq 1} \left\| h_{ni} \xi_1 + \cdots + h_{nn} \xi_n \right\|_{\text{Pettis}} \to 0.
\]

(iii) \( U \) is absolutely summing if and only if
\[
\int_{\Omega} \sup_{n \in \mathbb{N}} b_{nk}w_2(h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) d\mu(\omega) < \infty.
\]

(iv) \( U \) is nuclear if and only if \( U \) is absolutely summing and
\[
b_{nk}w_2(h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) \to 0 \quad \text{for } \mu\text{-a.e. } \omega \in \Omega.
\]

Proof. (a) Let \( g_n : \Omega \to L(X^*_n, l^n_1) \) be the function defined by
\[
(g_n(\omega))(x^*) = \left( x^*(h_{n1}(\omega)), \ldots, x^*(h_{nn}(\omega)) \right) \quad \text{for } \omega \in \Omega, x^* \in X^*_n
\]
i.e., \( g_n = \sum_{i=1}^{n} h_{ni} \otimes e_{ni} \), and \( V_n : C(\Omega) \to L(X^*_n, l^n_1) \)
\[
(V_n(f))(x^*) = \left( \int_{\Omega} f(\omega) x^*(h_{n1}(\omega)) d\mu(\omega), \ldots, \int_{\Omega} f(\omega) x^*(h_{nn}(\omega)) d\mu(\omega) \right).
\]

Observe that
\[
V_n(f) = \int_{\Omega} f(\omega) g_n(\omega) d\mu(\omega).
\]
Further, because \( g_n \) is obvious Bochner integrable, by Hille’s theorem, see [3, Chapter II, Theorem 2.6, p. 47], for each \( E \in \Sigma_{\Omega}, x^* \in X^*_n \), we have
\[
\left( \int_{E} g_n(\omega) d\mu(\omega) \right)(x^*) = \left( \int_{E} x^*(h_{n1}(\omega)) d\mu(\omega), \ldots, \int_{E} x^*(h_{nn}(\omega)) d\mu(\omega) \right)
\]
and thus
\[
\left\| \int_{E} g_n(\omega) d\mu(\omega) \right\|_{L(X^*_n, l^n_1)} = w_1 \left( \int_{E} h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right)
\]
which, by hypothesis, is convergent to zero. Proposition 5 assures that the operator \( V : C(\Omega) \to c_0(\ell^n_1) \) defined by
\[
V(f) = (V_n(f))_{n \in \mathbb{N}}
\]
takes its values in \( c_0(\ell^n_1) \) if and only if \( V \) takes its values in \( c_0(\ell^n_1) \), which, as we already proved, is true.

Let \( f \in C(\Omega) \). From Lemma 4 we have
\[
\| \text{Average} \left( \int_{\Omega} f(\omega) h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) \|_{\infty} \leq w_1 \left( \int_{\Omega} f(\omega) h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) = \| V_n(f) \|
\]
and hence \( U \) takes its values in \( c_0(\ell^n_1) \) if and only if \( V \) takes its values in \( c_0(\ell^n_1) \), which, as we already proved, is true.

From (1) we deduce
\[
c \| V(f) \| \leq \| U(f) \| \leq C \| V(f) \|
\]
for some constants \( c, C > 0 \) independent of \( f \).

This shows that \( U \) is compact (resp. \( U \) is absolutely summing) if and only if \( V \) is compact (resp. \( V \) is absolutely summing) which by Proposition 5 gives (ii) and (iii).

Since (i) and (iv) do not follow from Proposition 5, we argue as follows. The representing measure of \( U \) is
\[
G(E) = \left( \text{Average} \left( \int_{E} h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) \right)_{n \in \mathbb{N}} \quad \text{for } E \in \Sigma_\Omega.
\]

From Lemma 4 and hypothesis, for each \( E \in \Sigma_\Omega \)
\[
\| \text{Average} \left( \int_{E} h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) \|_{\infty} \leq w_1 \left( \int_{E} h_{ni}(\omega) d\mu(\omega) \mid 1 \leq i \leq n; X_n \right) \to 0,
\]
thus \( U \) is weakly compact.

By [3, Chapter VI], \( U \) is nuclear if and only if \( U \) is absolutely summing and \( G \) has a \( \mu \)-Bochner integrable derivative, and this, by Proposition 1(iv) in [8], is equivalent to
\[
\| \text{Average} (h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) \|_{\infty} \to 0 \quad \text{for } \mu\text{-a.e. } \omega \in \Omega.
\]

Then (iv) follows, because by Lemma 4, for each \( \omega \in \Omega \)
\[
\| \text{Average} (h_{ni}(\omega) \mid 1 \leq i \leq n; X_n) \|_{\infty} = w_1 \left( h_{ni}(\omega) \mid 1 \leq i \leq n; X_n \right) \to 0.
\]

(b) As we will see in the sequel the proof of (b) is similar to that of (a). Indeed, in this case, let \( g_n : \Omega \to \ell^n_2 \) be the function defined by
\[
(g_n(\omega))(x^*) = b_{nk} (x^*(h_{n1}(\omega)) \ldots, x^*(h_{nn}(\omega))) \quad \text{for } \omega \in \Omega, x^* \in X^*_n,
\]
AVERAGES, COMPACT, ABSOLUTELY SUMMING AND NUCLEAR OPERATORS 909

\( V_n : C(\Omega) \to L(X_n^*, l_2^n) \) the operator defined by

\[
(V_n(f))(x^*) = b_{nk} \left( \int \omega f(\omega) x^*(h_{n1}(\omega)) d\mu(\omega) , \ldots , \int \omega f(\omega) x^*(h_{nn}(\omega)) d\mu(\omega) \right)
\]

and observe that

\[
V_n(f) = \int f(\omega) g_n(\omega) d\mu(\omega).
\]

Further, because \( g_n \) is Bochner integrable, as in (a) we deduce that for each \( E \in \Sigma_\Omega \)

\[
\left\| \frac{1}{w_2} \left( \int f(\omega) h_{ni}(\omega) d\mu(\omega) \right) \right\|_{L(X_n^*, l_2^n)} \leq b_{nk}w_2 \left( \int f(\omega) h_{ni}(\omega) d\mu(\omega) \right) \rightarrow 0
\]

which, by hypothesis, is convergent to zero. Proposition 5 assures that the operator \( V : C(\Omega) \to c_0(L(X_n^*, l_2^n) \mid n \in \mathbb{N}) \) defined by

\[
V(f) = (V_n(f))_{n \in \mathbb{N}}
\]

takes its values in \( c_0(L(X_n^*, l_2^n) \mid n \in \mathbb{N}) \).

Let \( f \in C(\Omega) \). From Lemma 4 we have

\[
\left\| \frac{1}{w_2} \left( \int f(\omega) h_{ni}(\omega) d\mu(\omega) \right) \right\|_{L(X_n^*, l_2^n)} \leq b_{nk}w_2 \left( \int f(\omega) h_{ni}(\omega) d\mu(\omega) \right) \rightarrow 0
\]

and hence \( U \) takes its values in \( c_0(X_n \mid n \in \mathbb{N}) \) if and only if \( V \) takes its values in \( c_0(L(X_n^*, l_2^n) \mid n \in \mathbb{N}) \), which is true.

From (2) we deduce

\[
\| V(f) \| \leq \| U(f) \| \leq C \| V(f) \|
\]

for some constants \( c, C > 0 \) independent of \( f \).

This shows that \( U \) is compact (resp. \( U \) is absolutely summing) if and only if \( V \) is compact (resp. \( V \) is absolutely summing) and Proposition 5 gives (ii) and (iii).

The representing measure of \( U \) is

\[
G(E) = \left( \text{Average}_k \left( \int_E h_{ni}(\omega) d\mu(\omega) \right) \mid 1 \leq i \leq n; X_n \right)_{n \in \mathbb{N}}
\]

for \( E \in \Sigma_\Omega \).

From Lemma 4, for each \( E \in \Sigma_\Omega \)

\[
\left\| \text{Average}_k \left( \int_E h_{ni}(\omega) d\mu(\omega) \right) \right\|_{L(X_n^*, l_2^n)} \leq b_{nk}w_2 \left( \int E h_{ni}(\omega) d\mu(\omega) \right) \rightarrow 0
\]

by hypothesis, thus \( U \) is weakly compact.
By [3, Chapter VI], $U$ is nuclear if and only if $U$ is absolutely summing and $G$ has a $\mu$-Bochner integrable derivative, and this by Proposition 1(iv) in [8], is equivalent to

$$\|\text{Average}_k (h_{ni} (\omega) \mid 1 \leq i \leq n; X_n)\|_{\infty} \to 0 \quad \text{for } \mu\text{-a.e. } \omega \in \Omega.$$ 

Then (iv) follows, because by Lemma 4, for each $\omega \in \Omega$

$$\|\text{Average}_k (h_{ni} (\omega) \mid 1 \leq i \leq n; X_n)\|_{\infty} \approx b_{nk} w_2 (h_{ni} (\omega) \mid 1 \leq i \leq n; X_n). \; \Box$$

In the next corollary, item (a) is an obvious extension of Example 3 in [8]. In addition to [8], it is natural to study the same problem for averages of order greater or equal than two, i.e., item (b).

**Corollary 7.** Let $(X_n)_{n \in \mathbb{N}}$ be a sequence of Banach spaces, $(x_{ni})_{1 \leq i \leq n} \subset X_n$.

(a) Suppose $\sup_{n \in \mathbb{N}} w_2 (x_{ni} \mid 1 \leq i \leq n; X_n) < \infty$ and let $U : C[0,1] \to c_0 (X_n \mid n \in \mathbb{N})$ be the operator defined by

$$U (f) = \left( \text{Average}_k \left( x_{ni} \int_0^1 f (t) r_{ni} (t) \, dt \mid 1 \leq i \leq n; X_n \right) \right)_{n \in \mathbb{N}}.$$ 

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if $w_2 (x_{ni} \mid 1 \leq i \leq n; X_n) \to 0$.

(iii) $U$ is absolutely summing if and only if $\sup_{n \in \mathbb{N}} w_1 (x_{ni} \mid 1 \leq i \leq n; X_n) < \infty$.

(iv) $U$ is nuclear if and only if $w_1 (x_{ni} \mid 1 \leq i \leq n; X_n) \to 0$.

(b) Let $k \geq 2$ be a natural number. Suppose $\sup_{n \in \mathbb{N}} (b_{nk} \max_{1 \leq i \leq n} \| x_{ni} \|) < \infty$ and let $U : C[0,1] \to c_0 (X_n \mid n \in \mathbb{N})$ be the operator defined by

$$U (f) = \left( \text{Average}_k \left( x_{ni} \int_0^1 f (t) r_{ni} (t) \, dt \mid 1 \leq i \leq n; X_n \right) \right)_{n \in \mathbb{N}}.$$ 

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if $b_{nk} \max_{1 \leq i \leq n} \| x_{ni} \| \to 0$.

(iii) $U$ is absolutely summing if and only if $\sup_{n \in \mathbb{N}} b_{nk} w_2 (x_{ni} \mid 1 \leq i \leq n; X_n) < \infty$.

(iv) $U$ is nuclear if and only if $b_{nk} w_2 (x_{ni} \mid 1 \leq i \leq n; X_n) \to 0$.

**Proof.** Take $h_{ni} = x_{ni} r_{ni} \in L_1 (\lambda, X_n)$ in Proposition 6.

(a) For each $E \in \mathcal{B}$, by Cauchy-Buniakowski-Schwartz’s inequality and hypothesis we have

$$w_1 \left( \int_E x_{ni} r_{ni} (t) \, dt \mid 1 \leq i \leq n; X_n \right) = \sup_{\| x^* \| \leq 1} \left( \| x^* (x_{n1}) \| \int_E r_{n+1} (t) \, dt + \cdots + \| x^* (x_{nn}) \| \int_E r_{2n} (t) \, dt \right)$$

\[ \leq w_2 \left( x_{ni} \mid 1 \leq i \leq n; X_n \right) \left( \left\| r_{n+1}(t) dt \right\| + \cdots + \left\| r_{2n}(t) dt \right\| \right)^{\frac{1}{2}} \rightarrow 0. \]

(i) follows from Proposition 6(a)(i).

From the definition of Pettis norm and Khinchin's inequality we get

\[ \sup_{\| \varepsilon \| \leq 1} \| x_{n1} r_{n+1} \varepsilon_1 + \cdots + x_{nn}^* r_{2n} \varepsilon_n \|_{\text{Pettis}} \approx w_2 \left( x_{ni} \mid 1 \leq i \leq n; X_n \right) \]

and (ii) follows from Proposition 6(a)(ii).

Further for each \( t \in [0, 1] \), \( | r_n(t) | = 1 \),

\[ w_1 \left( x_{ni}, r_{n+i} (t) \mid 1 \leq i \leq n; X_n \right) = w_1 \left( x_{ni} \mid 1 \leq i \leq n; X_n \right) \]

and (iii), (iv) follow from Proposition 6(a)(iii), (iv).

(b) We observe that the hypothesis in Proposition 6(b) are satisfies because, in our hypothesis, for each \( E \in B \)

\[ b_{nk} w_2 \left( x_{ni} \int_E r_{n+i}(t) dt \mid 1 \leq i \leq n; X_n \right) \]

\[ = b_{nk} \sup_{\| x^* \| \leq 1} \left( | x^* (x_{n1})^2 | \left\| r_{n+1} (t) dt \right\|^2 + \cdots + | x^* (x_{nn})^2 | \left\| r_{2n} (t) dt \right\|^2 \right)^{\frac{1}{2}} \]

\[ \leq \left( b_{nk} \max_{1 \leq i \leq n} \| x_{ni} \| \right) \left( \left\| r_{n+1} (t) dt \right\|^2 + \cdots + \left\| r_{2n} (t) dt \right\|^2 \right)^{\frac{1}{2}} \rightarrow 0. \]

(i) follows from Proposition 6(b)(i). From the definition of Pettis norm, Khinchin's inequality and Result we get

\[ \sup_{\| \xi \| \leq 1} \| x_{n1} r_{n+1} \xi_1 + \cdots + x_{nn} r_{2n} \xi_n \|_{\text{Pettis}} \]

\[ \approx \sup_{\| x^* \| \leq 1} \sup_{\| \xi \| \leq 1} \| (\xi_1 x^* (x_{n1}), \ldots, \xi_n x^* (x_{nn})) \|_2 \]

\[ = \sup_{\| x^* \| \leq 1} \| (x^* (x_{n1}), \ldots, x^* (x_{nn})) \|_\infty \]

\[ = \max_{1 \leq i \leq n} \| x^* (x_{ni}) \| \]

\[ = \max_{1 \leq i \leq n} \| x_{ni} \|. \]

From Proposition 6(b)(ii) we get (ii).

(iii), (iv) follow from Proposition 6(b)(iii), (iv), because for each \( t \in [0, 1] \)

\[ w_2 \left( x_{ni}, r_{n+i} (t) \mid 1 \leq i \leq n; X_n \right) = w_2 \left( x_{ni} \mid 1 \leq i \leq n; X_n \right). \]

\[ \square \]

Remark. As in the proof of Example 3 in [8], it can be proved that for the operator \( U \) defined as in Corollary 7, either \( U \) is absolutely summing, or its representing measure is of everywhere infinite variation, see [4].
4. The examples

In our examples, in view of Corollary 7, we need the following well-known result. For the sake of completeness we include a short proof.

**Proposition 8.** (i) Let $X$ be a Banach space, $A \subset B_X$, norming for $X$, $(x_i)_{1 \leq i \leq n} \subset X$ and $1 \leq p < \infty$. Then

$$w_p(x_i \mid 1 \leq i \leq n; X) = \sup_{x^* \in A} \|\langle x^* (x_1), \ldots, x^* (x_n) \rangle\|_p.$$  

(iii) Let $\Omega$ be a compact Hausdorff space, $(f_i)_{1 \leq i \leq n} \subset C(\Omega)$, $f : \Omega \to \mathbb{K}^n$, $f (\omega) = (f_1 (\omega), \ldots, f_n (\omega))$ and $1 \leq p < \infty$. Then

$$w_p(f_i \mid 1 \leq i \leq n; C (\Omega)) = \|f\|_{C(\Omega, \mathbb{K}^n)}.$$  

(iii) Let $X, Y$ be Banach spaces, $U \in L(X, Y)$, $M > 0$ such that $\|x\| \leq \|U (x)\| \leq M \|x\|$ for any $x \in X$. Let $(x_i)_{1 \leq i \leq n} \subset X$ and $1 \leq p < \infty$. Then

$$w_p(x_i \mid 1 \leq i \leq n; X) \leq w_p(U (x_i) \mid 1 \leq i \leq n; Y) \leq Mw_p(x_i \mid 1 \leq i \leq n; X).$$  

(iv) Let $1 \leq r < \infty$, $1 \leq p \leq \infty$, $\lambda = (\lambda_1, \ldots, \lambda_n) \in \mathbb{K}^n$. Then

$$w_r (\lambda_1 e_{n_1} \mid 1 \leq i \leq n; l^p_\infty) = \|\lambda\|_{\ell^r_\infty (l^p_\infty)}.$$  

(vi) Let $1 \leq p, r < \infty$ and $\lambda = (\lambda_1, \ldots, \lambda_n) \in \mathbb{K}^n$. Then

$$w_r (\lambda r_i \mid 1 \leq i \leq n; L_p [0, 1]) = \|\lambda\|_\infty \text{ if } 2 \leq r,$$

or $\|\lambda\|_p$ if $1 \leq r < 2$, where $\frac{1}{p} = \frac{1}{r} - \frac{1}{2}$.  

(vii) Let $(S, \Sigma, \mu)$ be a measure space, $\{E_1, \ldots, E_n\} \subset \Sigma$ pairwise disjoint with $\mu (E_i) < \infty$ for each $1 \leq i \leq n$, $1 \leq p, r < \infty$. Then

$$w_r (\lambda_i \chi_{E_i} \mid 1 \leq i \leq n; L_p (\mu)) = \max_{1 \leq i \leq n} \left(\frac{\|\lambda_i\|_{\ell^r_\infty (l^p_\infty)}}{\mu (E_i)\|} \right) \text{ if } r^* \leq p,$$

or $\left(\sum_{i=1}^n |\lambda_i|^r \mu (E_i)\right)^{\frac{1}{r}}$ if $r^* > p$, where $\frac{1}{p} = \frac{1}{r^*} + \frac{1}{r}$.  

(viii) Let $(S, \Sigma, \mu)$ be a measure space, $1 \leq r < \infty$, $(g_i)_{1 \leq i \leq n} \subset L_\infty (\mu)$, $g : S \to \mathbb{K}^n$, $g (s) = (g_1 (s), \ldots, g_n (s))$. Then

$$w_r (g_i \mid 1 \leq i \leq n; L_\infty (\mu)) = \|g\|_{l^r_\infty (\mu, \ell^p_\infty)}.$$  

(ix) Let $(S, \Sigma, \mu)$ be a finite measure space, $1 \leq r < \infty$, $(g_i)_{1 \leq i \leq n} \subset L_1 (\mu)$ such that each $g_i$ takes positive values. Then

$$w_r (g_i \mid 1 \leq i \leq n; L_1 (\mu)) = \left\|\left(\int_S g_1 d\mu, \ldots, \int_S g_n d\mu\right)\right\|_r.$$
Let $(S, \Xi, \nu)$ be a finite measure space, $1 \leq r < \infty$, $(g_i)_{1 \leq i \leq n} \subset L_1(\nu)$ and \( g : S \to \mathbb{K}^n \) defined by \( g(s) = (g_1(s), \ldots, g_n(s)) \). Then
\[
w_1(r; g_i \mid 1 \leq i \leq n; L_1(\lambda \otimes \nu)) \asymp \int_{S} \|g(s)\|_2 \, d\nu(s)
\]
and if \( r > 1 \)
\[
w_r(r; g_i \mid 1 \leq i \leq n; L_1(\lambda \otimes \nu)) \asymp \sup_{\beta \in l^p_{r \ast}, \|\beta\|_r \leq 1} \int_{S} \|M_\beta (g(s))\|_2 \, d\nu(s).
\]

(ii) Let $(S, \Xi, \nu)$ be a finite measure space, $1 \leq r < \infty$, $(E_i)_{1 \leq i \leq n} \subset \Xi$ a partition of \( S \), \((a_i)_{1 \leq i \leq n} \subset \mathbb{K} \). Then
\[
w_r(a_i \chi_{E_i} \mid 1 \leq i \leq n; L_1(\lambda \otimes \nu)) \asymp \|\langle a_1 \nu(E_1), \ldots, a_n \nu(E_n)\rangle\|_r.
\]

Proof. (i) See [6, Lemma 1.1.15, p. 40] where the proof use the equality
\[(1) \quad w_p(x_i \mid 1 \leq i \leq n; X) = \sup_{\|\lambda\|_{p \ast} \leq 1} \|\lambda_1 x_1 + \cdots + \lambda_n x_n\|.
\]

(ii) See [6, Example 1.1.16, p. 40]; it is a particular case of (i), \( \{\delta_\omega \mid \omega \in \Omega\} \) being norming for \( C(\Omega) \).

(iii) and (iv) follow from hypothesis and (1).

(v) By (1) we have
\[
w_p(x_i \mid 1 \leq i \leq n; l^p_{r \ast}) = \sup_{\|\lambda\|_{p \ast} \leq 1} \|\lambda_1 x_1 + \cdots + \lambda_n x_n\|_\infty = \sup_{\|\lambda\|_{p \ast} \leq 1} \max_{1 \leq j \leq n} |\lambda_1 x_{1j} + \cdots + \lambda_n x_{nj}| = \max_{1 \leq j \leq n} \|\langle x_{1j}, \ldots, x_{nj}\rangle\|_p = \|\beta\|_{l^p_{\ast}(p)}.
\]

(vi) From (1) and Khinchin’s inequality
\[
w_r(\lambda_i r_i \mid 1 \leq i \leq n; L_p[0, 1]) = \sup_{\beta \in l^p_{r \ast}, \|\beta\|_r \leq 1} \left\|\sum_{i=1}^{n} \lambda_i \beta_i r_i\right\|_{L_p[0, 1]} 
\asymp \sup_{\beta \in l^p_{r \ast}, \|\beta\|_r \leq 1} \left(\sum_{i=1}^{n} |\lambda_i |^2 \beta_i^2\right)^{\frac{p}{2}} = \|M_\lambda : l^p_{r \ast} \to l^{p \ast}_{1/2}\|.
\]

The assertion follows from well-known formula of the norm of the multiplication operator.

(vii) Again (1) gives
\[
w_r(\lambda_i \chi_{E_i} \mid 1 \leq i \leq n; L_p(\mu)) = \sup_{\beta \in l^p_{r \ast}, \|\beta\|_r \leq 1} \left\|\sum_{i=1}^{n} \lambda_i \beta_i \chi_{E_i}\right\|_{L_p(\mu)}
\]
inequality gives
by integration we obtain
and from here, by Hölder’s inequality
where \( \nu = \left( \lambda_1 [\mu(E_1)]^{\frac{1}{p}}, \ldots, \lambda_n [\mu(E_n)]^{\frac{1}{p}} \right) \). We use again the norm of the multiplication operator.

(viii) See [6, Example 1.1.17, p. 40].

(ix) By (1) we have

\[
\sup_{\|\beta\|_p \leq 1} \left( \sum_{i=1}^{n} \left| \lambda_i \beta_i \right|^p \mu(E_i) \right)^{\frac{1}{p}} = \| M_{\nu} : L^p \rightarrow \ell^p \|.
\]

For each \( \|\beta\|_r \leq 1 \) we have

\[
\left| \int_S g_1 \, d\mu, \ldots, \int_S g_n \, d\mu \right|_r \leq \sup_{\|\beta\|_r \leq 1} \left( \int_S \left| \sum_{i=1}^{n} \beta_i g_i \right| \, d\mu \right).
\]

and from here, by Hölder’s inequality

\[
\left\| \left( \int_S g_1 \, d\mu, \ldots, \int_S g_n \, d\mu \right) \right\|_r \leq \sup_{\|\beta\|_r \leq 1} \left( \int_S \left| \sum_{i=1}^{n} \beta_i g_i \right| \, d\mu \right).
\]

For the right inequality, from \( \int_S \sum_{i=1}^{n} \beta_i g_i \, d\mu \leq \sum_{i=1}^{n} |\beta_i| \int_S |g_i| \, d\mu \), Hölder’s inequality gives

\[
w_r (g_i \mid 1 \leq i \leq n; L_1 (\mu)) \leq \left( \left( \int |g_1| \, d\mu, \ldots, \int |g_n| \, d\mu \right) \right)_r.
\]

Because each \( g_i \) takes positive values the statement follows.

(s) By (1)

\[
w_r (r_i g_i \mid 1 \leq i \leq n; L_1 (\lambda \otimes \nu)) = \sup_{\|\beta\|_r \leq 1} \left( \int_{[0, 1] \times S} \left| \sum_{i=1}^{n} \beta_i r_i (t) g_i (s) \right| \, dtd\nu (s) \right).
\]

The Fubini theorem gives

\[
\int_{[0, 1] \times S} \left| \sum_{i=1}^{n} \beta_i r_i (t) g_i (s) \right| \, dtd\nu (s) = \int_S \left( \int_0^1 \left| \sum_{i=1}^{n} \beta_i r_i (t) g_i (s) \right| \, dt \right) \, d\nu (s).
\]

Since for each \( s \in S \), by Khinchin’s inequality,

\[
\int_0^1 \left( \sum_{i=1}^{n} \beta_i r_i (t) g_i (s) \right) \, dt \leq \left( \sum_{i=1}^{n} |\beta_i|^2 |g_i (s)|^2 \right)^{\frac{1}{2}}
\]

by integration we obtain

\[
w_r (r_i g_i \mid 1 \leq i \leq n : L_1 (\lambda \otimes \nu)) \leq \sup_{\|\beta\|_r \leq 1} \int_S \| M_{\beta} (g (s)) \|_2 \, d\nu (s).
\]

In case \( r = 1 \), we have \( \sup_{\|\beta\|_\infty \leq 1} \int_S \| M_{\beta} (g (s)) \|_2 \, d\nu (s) = \int_S \| g (s) \|_2 \, d\nu (s) \) and the statement follows.
(xii) is a particular case of (x). In this situation \( g : S \to \mathbb{K}^n \) is defined by \( g(s) = (a_1 \chi_{E_1}(s), \ldots, a_n \chi_{E_n}(s)) \). In case \( r = 1 \), since \((E_i)_{1 \leq i \leq n}\) is a partition of \( S \), \( \|g(s)\|_2 = |a_1| \chi_{E_1}(s) + \cdots + |a_n| \chi_{E_n}(s) \) and the statement follows. In case \( r > 1 \), for each \( \beta \in l_p^r \),
\[
\|M_\beta(g(s))\|_2 = |a_1| \|\beta_1| \chi_{E_1}(s) + \cdots + |a_n| \|\beta_n| \chi_{E_n}(s)
\]
and thus by (x)
\[
w_r(a_1, \ldots, a_n) = \sup_{\beta \in l_p, \|\beta\|_r \leq 1} \left( \sum_{i=1}^n |a_i| |\beta_i| \nu(E_i) \right) = \| (a_1 \nu(E_1), \ldots, a_n \nu(E_n)) \|_r.
\]

In the next example item (a) is a natural extension of Example 3 in [8]; for \( \Omega_n = \{1\} \), a singleton, \( C(\Omega_n) = \mathbb{K} \). Further, item (b) is a natural completion of the same example. The proof follows from Corollary 7 and Proposition 8(ii).

**Example 9.** Let \((\Omega_n)_{n \in \mathbb{N}}\) be a sequence of compact Hausdorff spaces,
\[
(\varphi_{ni})_{1 \leq i \leq n} \subset C(\Omega_n), \quad \varphi_n : \Omega_n \to \mathbb{K}^n, \quad \varphi_n(\omega) = (\varphi_{n1}(\omega), \ldots, \varphi_{nn}(\omega)).
\]
(a) Denote \( \varphi = (\varphi_{n})_{n \in \mathbb{N}} \) and suppose that \( \varphi \in \ell_\infty(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \). Let \( U : C[0, 1] \to c_0(C(\Omega_n) \mid n \in \mathbb{N}) \) be the operator defined by
\[
U(f) = \left( \text{Average}_{\varphi_{ni}} \left( \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; C(\Omega_n) \right) \right)_{n \in \mathbb{N}}.
\]
Then
(i) \( U \) is weakly compact.
(ii) \( U \) is compact if and only if \( \varphi \in c_0(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).
(iii) \( U \) is absolutely summing if and only if \( \varphi \in \ell_\infty(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).
(iv) \( U \) is nuclear if and only if \( \varphi \in c_0(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).

(a) Let \( k \geq 2 \) be a natural number. Denote \( \varphi_{\text{mod}} = (b_k \varphi_{n})_{n \in \mathbb{N}} \) and suppose that \( \varphi_{\text{mod}} \in \ell_\infty(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \). Let \( U : C[0, 1] \to c_0(C(\Omega_n) \mid n \in \mathbb{N}) \) be the operator defined by
\[
U(f) = \left( \text{Average}_{\varphi_{ni}} \left( \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; C(\Omega_n) \right) \right)_{n \in \mathbb{N}}.
\]
Then
(i) \( U \) is weakly compact.
(ii) \( U \) is compact if and only if \( \varphi_{\text{mod}} \in c_0(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).
(iii) \( U \) is absolutely summing if and only if \( \varphi_{\text{mod}} \in \ell_\infty(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).
(iv) \( U \) is nuclear if and only if \( \varphi_{\text{mod}} \in c_0(C(\Omega_n, l_2^n) \mid n \in \mathbb{N}) \).

To avoid repetitions in Examples 10, 13-16, if \((\alpha_{ni})_{1 \leq i \leq n, n \in \mathbb{N}}\) is a triangular matrix of scalars, which in the statement of these examples will be written as \((\alpha_{ni})_{i,n} \), we denote \( \alpha_n = (\alpha_{1n}, \ldots, \alpha_{nn}) \), \( \alpha = (\alpha_n)_{n \in \mathbb{N}} \) and \( \alpha_{\text{mod}} = (b_k \alpha_n)_{n \in \mathbb{N}} \) for a natural number \( k \geq 2 \).
Also, in Examples 13(c), 14(c), 15(cc), if \((\alpha_{nij})_{1 \leq i \leq n, 1 \leq j \leq n, n \in \mathbb{N}} \subset \mathbb{K}\), which in the statement of these examples will be written as \((\alpha_{nij})_{i,j,n}\); we denote \(\beta_{nij} = (\alpha_{n1j}, \ldots, \alpha_{nnj})\), \(\beta_n = (\beta_{n1}, \ldots, \beta_{nn})\), \(\beta = (\beta_n)_{n \in \mathbb{N}}\) and \(\beta_{\text{mod}} = (b_{nk}\beta_n)_{n \in \mathbb{N}}\) for a natural number \(k \geq 2\).

The proof of the next example in case 1 \(1 < p \leq \infty\) (resp. \(p = \infty\)) follows from Corollary 7 and Proposition 8(vi) (resp. (viii)).

**Example 10.** (a) Let \(1 \leq p < \infty\), \((\alpha_{n})_{i,n}\) be such that \(\alpha \in l_\infty (l_p^n | n \in \mathbb{N})\) and \(U : C[0, 1] \rightarrow c_0 (L_p [0, 1])\)

\[
U(f) = \left( \text{Average}_{k} \left( \alpha_{ni} r_i \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; L_p [0, 1] \right) \right)_{n \in \mathbb{N}}.
\]

Then
(i) \(U\) is weakly compact.
(ii) \(U\) is compact if and only if \(\alpha \in c_0 (l_\infty^n | n \in \mathbb{N})\).
(iii) \(U\) is absolutely summing if and only if \(\alpha \in l_\infty (l_\infty^n | n \in \mathbb{N})\).
(iv) \(U\) is nuclear if and only if \(\alpha \in c_0 (l_\infty^2 | n \in \mathbb{N})\).

(au) Let \(k \geq 2\) be a natural number, \(1 \leq p < \infty\), \((\alpha_{n})_{i,n}\) such that \(\alpha_{\text{mod}} \in l_\infty (l_\infty^n | n \in \mathbb{N})\) and \(U : C[0, 1] \rightarrow c_0 (L_p [0, 1])\)

\[
U(f) = \left( \text{Average}_{k} \left( \alpha_{ni} r_i \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; L_\infty [0, 1] \right) \right)_{n \in \mathbb{N}}.
\]

Then \(U\) is absolutely summing; \(U\) is compact if and only if \(U\) is nuclear if and only if \(\alpha_{\text{mod}} \in c_0 (l_\infty^n | n \in \mathbb{N})\).

(b) Let \((\alpha_{n})_{i,n}\) be such that \(\alpha \in l_\infty (l_\infty^2 | n \in \mathbb{N})\) and \(U : C[0, 1] \rightarrow c_0 (L_\infty [0, 1])\) the operator defined by

\[
U(f) = \left( \text{Average}_{k} \left( \alpha_{ni} r_i \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; L_\infty [0, 1] \right) \right)_{n \in \mathbb{N}}.
\]

Then
(i) \(U\) is weakly compact.
(ii) \(U\) is compact if and only if \(\alpha \in c_0 (l_\infty^n | n \in \mathbb{N})\).
(iii) \(U\) is absolutely summing if and only if \(\alpha \in l_\infty (l_\infty^n | n \in \mathbb{N})\).
(iv) \(U\) is nuclear if and only if \(\alpha \in c_0 (l_\infty^2 | n \in \mathbb{N})\).

(bb) Let \(k \geq 2\) be a natural number, \((\alpha_{n})_{i,n}\) such that \(\alpha_{\text{mod}} \in l_\infty (l_\infty^n | n \in \mathbb{N})\) and \(U : C[0, 1] \rightarrow c_0 (L_\infty [0, 1])\)

\[
U(f) = \left( \text{Average}_{k} \left( \alpha_{ni} r_i \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; L_\infty [0, 1] \right) \right)_{n \in \mathbb{N}}.
\]

Then
(i) \(U\) is weakly compact.
(ii) \(U\) is compact if and only if \(\alpha_{\text{mod}} \in c_0 (l_\infty^n | n \in \mathbb{N})\).
(iii) \(U\) is absolutely summing if and only if \(\alpha_{\text{mod}} \in l_\infty (l_\infty^n | n \in \mathbb{N})\).
(iv) \(U\) is nuclear if and only if \(\alpha_{\text{mod}} \in c_0 (l_\infty^2 | n \in \mathbb{N})\).
The next example is a natural extension of Example 10(b), (bb). The proof follows from Corollary 7 and Proposition 8(viii). We remark that in the next example, if:

1) \( S_n = [0, 1], \mu_n = \lambda \) and all \( (g_{ni})_{1 \leq i \leq n, n \in \mathbb{N}} \subset L_\infty (\mu_n) \) are continuous, then we must replace \( L_\infty (\mu_{n*}) \) with \( C([0, 1], \cdot) \).

2) \( S_n = [0, 1], \mu_n = \lambda \) and \( g_{ni} = \alpha_{ni} r_i \) we get Example 10(b), (bb).

**Example 11.** Let \( (S_n, \Sigma_n, \mu_n)_{n \in \mathbb{N}} \) be a sequence of finite measure spaces,

\[
(g_{ni})_{1 \leq i \leq n, n \in \mathbb{N}} \subset L_\infty (\mu_n), \ g_n : \Omega_n \to \mathbb{K}^n, \ g_n = (g_{n1}, \ldots, g_{nn}) .
\]

(a) Denote \( g = (g_n)_{n \in \mathbb{N}} \) and suppose that \( g \in L_\infty (L_\infty (\mu_n, l^n_0) | n \in \mathbb{N}) \).

Let \( U : C[0, 1] \to c_0 (L_\infty (\mu_n) | n \in \mathbb{N}) \) be the operator defined by

\[
U(f) = \left( \text{Average} \left( g_{ni} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; \ L_\infty (\mu_n) \right) \right)_{n \in \mathbb{N}} .
\]

Then

(i) \( U \) is weakly compact.

(ii) \( U \) is compact if and only if \( g \in c_0 (L_\infty (\mu_n, l^n_0) | n \in \mathbb{N}) \).

(iii) \( U \) is absolutely summing if and only if \( g \in l_\infty (L_\infty (\mu_n, l^n_1) | n \in \mathbb{N}) \).

(iv) \( U \) is nuclear if and only if \( g \in c_0 (L_\infty (\mu_n, l^n_1) | n \in \mathbb{N}) \).

(a) Let \( k \geq 2 \) be a natural number and denote \( g_{mod} = (b_{nk} g_n)_{n \in \mathbb{N}} \). Suppose that \( g_{mod} \in L_\infty (L_\infty (\mu_n, l^n_0) | n \in \mathbb{N}) \) and let \( U : C[0, 1] \to c_0 (L_\infty (\mu_n) | n \in \mathbb{N}) \) be the operator defined by

\[
U(f) = \left( \text{Average}_k \left( g_{ni} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; \ L_\infty (\mu_n) \right) \right)_{n \in \mathbb{N}} .
\]

Then

(i) \( U \) is weakly compact.

(ii) \( U \) is compact if and only if \( g_{mod} \in c_0 (L_\infty (\mu_n, l^n_0) | n \in \mathbb{N}) \).

(iii) \( U \) is absolutely summing if and only if \( g_{mod} \in l_\infty (L_\infty (\mu_n, l^n_1) | n \in \mathbb{N}) \).

(iv) \( U \) is nuclear if and only if \( g_{mod} \in c_0 (L_\infty (\mu_n, l^n_1) | n \in \mathbb{N}) \).

The proof of the next example follows from Corollary 7 and Proposition 8(ix).

**Example 12.** Let \( (S_n, \Sigma_n, \mu_n)_{n \in \mathbb{N}} \) be a sequence of finite measure spaces,

\[ (g_{ni})_{1 \leq i \leq n, n \in \mathbb{N}} \subset L_1 (\mu_n) . \]

(a) Denote \( \beta_n = \left( \int_S g_{n1} d\mu_n, \ldots, \int_S g_{nn} d\mu_n \right) \), \( \beta = (\beta_n)_{n \in \mathbb{N}} \), suppose that each \( g_{ni} \) takes positive values and \( \beta \in l_\infty (l^n_0 | n \in \mathbb{N}) \).

Let \( U : C[0, 1] \to c_0 (L_1 (\mu_n) | n \in \mathbb{N}) \) be the operator defined by

\[
U(f) = \left( \text{Average} \left( g_{ni} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n; \ L_1 (\mu_n) \right) \right)_{n \in \mathbb{N}} .
\]

Then

(i) \( U \) is weakly compact.

(ii) \( U \) is compact if and only if \( \beta \in c_0 (l^n_0 | n \in \mathbb{N}) \).
(iii) $U$ is absolutely summing if and only if $\beta \in l_\infty (l_p^1 \mid n \in \mathbb{N})$.
(iv) $U$ is nuclear if and only if $\beta \in c_0 (l_p^0 \mid n \in \mathbb{N})$.

(a) Let $\beta = (b_n)_{n \in \mathbb{N}}$ and suppose that $\beta \in l_\infty (l_p^0 \mid n \in \mathbb{N})$.

Let $U : C[0,1] \to c_0 (L_1 (\mu_n) \mid n \in \mathbb{N})$ be the operator defined by

$$U (f) = \left( \text{Average}_n \left( \int_0^1 f(t) r_n (t) \, dt \mid 1 \leq i \leq n \right) : L_1 (\mu_n) \right)_{n \in \mathbb{N}}.$$  

Then

(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if $\beta \in c_0 (l_p^0 \mid n \in \mathbb{N})$.

(iii) If, in addition, each $g_{ni}$ takes positive values, $U$ is absolutely summing if and only if $\beta \in l_\infty (l_p^0 \mid n \in \mathbb{N})$.

(iv) If, in addition, each $g_{ni}$ takes positive values, $U$ is nuclear if and only if $\beta \in c_0 (l_p^0 \mid n \in \mathbb{N})$.

In the rest of the paper, if $1 \leq p < 2$ define $r$ by $\frac{1}{p} = \frac{1}{2} + \frac{1}{p}$. The proof of the next example follows from Corollary 7 and Proposition 8(iv) and (v).

Example 13. (a) Let $(\alpha_{i,n})_{i,n}$ be such that $\alpha \in l_\infty (l_p^0 \mid n \in \mathbb{N})$ if $1 \leq p < 2$, or $\alpha \in l_\infty (l_p^0 \mid n \in \mathbb{N})$ if $2 \leq p$ and $U : C[0,1] \to c_0 (l_p^0 \mid n \in \mathbb{N})$

$$U (f) = \left( \text{Average}_n \left( \alpha_{n,i} \int_0^1 f(t) r_n (t) \, dt \mid 1 \leq i \leq n \right) : l_p^0 \right)_{n \in \mathbb{N}}.$$  

Then

(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if $\alpha \in c_0 (l_p^0 \mid n \in \mathbb{N})$ for $1 \leq p < 2$, or $\alpha \in c_0 (l_p^0 \mid n \in \mathbb{N})$ for $2 \leq p$.

(iii) $U$ is absolutely summing if and only if $\alpha \in l_\infty (l_p^0 \mid n \in \mathbb{N})$.

(iv) $U$ is nuclear if and only if $\alpha \in c_0 (l_p^0 \mid n \in \mathbb{N})$.

(b) Let $(\alpha_{i,n})_{i,n}$ be such that $\alpha \in l_\infty (l_p^0 \mid n \in \mathbb{N})$ and $U : C[0,1] \to c_0 (l_p^0 \mid n \in \mathbb{N})$ the operator defined by

$$U (f) = \left( \text{Average}_n \left( \alpha_{n,i} \int_0^1 f(t) r_n (t) \, dt \mid 1 \leq i \leq n \right) : l_p^0 \right)_{n \in \mathbb{N}}.$$  

Then $U$ is absolutely summing; $U$ is compact if and only if $U$ is nuclear if and only if $\alpha \in c_0 (l_p^0 \mid n \in \mathbb{N})$.

(c) Let $(\alpha_{n,i,j,n})_{i,j,n}$ be such that $\beta \in l_\infty (l_p^0 \mid n \in \mathbb{N})$ and $U : C[0,1] \to c_0 (l_p^0 \mid n \in \mathbb{N})$ the operator defined by

$$U (f) = \left( \text{Average}_n \left( \alpha_{n,1} \int_0^1 f(t) r_n (t) \, dt \mid 1 \leq i \leq n \right) : l_p^0 \right)_{n \in \mathbb{N}}.$$
Then
(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if $\beta \in c_0 \left( l^p_\infty \left( l^q_\infty \right) \mid n \in \mathbb{N} \right)$.
(iii) $U$ is absolutely summing if and only if $\beta \in l_{\infty} \left( l^p_\infty \left( l^q_\infty \right) \mid n \in \mathbb{N} \right)$.
(iv) $U$ is nuclear if and only if $\beta \in c_0 \left( l^p_\infty \left( l^q_\infty \right) \mid n \in \mathbb{N} \right)$.

The next example is a natural completion of Example 13. The proof follows from Corollary 7 and Proposition 8(iv) and (v).

**Example 14.** (a) Let $k \geq 2$ be a natural number, $1 \leq p < \infty$, $(\alpha_{ni})_{i,n}$ such that $\alpha_{mod} \in l_\infty \left( l^p_\infty \mid n \in \mathbb{N} \right)$ and $U : C [0,1] \to c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$

$$U \left( f \right) = \left( \text{Average}_k \left( \alpha_{ni} e_{ni} \int_0^1 f (t) r_{ni+1} (t) \, dt \mid 1 \leq i \leq n; l^p_\infty \right) \right)_{n \in \mathbb{N}}.$$ 

Then
(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if $\alpha_{mod} \in c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$.
(iii) for $p \geq 2$, $U$ is absolutely summing; for $1 \leq p < 2$, $U$ is absolutely summing if and only if $\alpha_{mod} \in l_\infty \left( l^p_\infty \mid n \in \mathbb{N} \right)$.

(iv) for $p \geq 2$, $U$ is nuclear if and only if $U$ is compact if and only if $\alpha_{mod} \in c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$; for $1 \leq p < 2$, $U$ is nuclear if and only if $\alpha_{mod} \in c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$.

(b) Let $k \geq 2$ be a natural number, $(\alpha_{ni})_{i,n}$ such that $\alpha_{mod} \in l_\infty \left( l^p_\infty \mid n \in \mathbb{N} \right)$ and $U : C [0,1] \to c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$

$$U \left( f \right) = \left( \text{Average}_k \left( \alpha_{ni} e_{ni} \int_0^1 f (t) r_{ni+1} (t) \, dt \mid 1 \leq i \leq n; l^p_\infty \right) \right)_{n \in \mathbb{N}}.$$ 

Then $U$ is absolutely summing; $U$ is compact if and only if $U$ is nuclear if and only if $\alpha_{mod} \in c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$.

(c) Let $k \geq 2$ be a natural number, $(\alpha_{nij})_{i,j,n}$ such that $\beta_{mod} \in l_\infty \left( l^p_\infty \left( l^p_\infty \right) \mid n \in \mathbb{N} \right)$ and $U : C [0,1] \to c_0 \left( l^p_\infty \mid n \in \mathbb{N} \right)$

$$U \left( f \right) = \left( \text{Average}_k \left( \alpha_{n1i} e_{ni} + \cdots + \alpha_{nni} e_{ni} \right) \int_0^1 f (t) r_{ni+1} (t) \, dt \mid 1 \leq i \leq n; l^p_\infty \right)_{n \in \mathbb{N}}.$$ 

Then
(i) $U$ is weakly compact.
(ii) $U$ is compact if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \left( l^p_\infty \right) \mid n \in \mathbb{N} \right)$.
(iii) $U$ is absolutely summing if and only if $\beta_{mod} \in l_\infty \left( l^p_\infty \left( l^p_\infty \right) \mid n \in \mathbb{N} \right)$.
(iv) $U$ is nuclear if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \left( l^p_\infty \right) \mid n \in \mathbb{N} \right)$.

The Examples 13 and 14 can be extended to a more general situation. For this we recall, that if $1 \leq p \leq \infty$, a Banach space $X$ contains $l^p$'s uniformly if and only if there exists $\lambda \geq 1$ such that for each $n \in \mathbb{N}$ there exists a bounded linear operator $J : l^p_n \to X$ such that

$$\| \xi \|_p \leq \| J \left( \xi \right) \|_X \leq \lambda \| \xi \|_p, \quad \forall \xi \in l^p_n.$$
A deep result of Krivine’s, see [7, p. 233], asserts that a Banach space $X$ contains $l_p^n$’s uniformly if and only if for all $\lambda > 1$, all $n \in \mathbb{N}$ there exists a bounded linear operator $J : l_p^n \to X$ such that

$$\|\xi\|_p \leq \|J(\xi)\|_X \leq \lambda \|\xi\|_p, \forall \xi \in l_p^n.$$ 

For example, from Khinchin’s inequality it follows that for each $1 \leq p < \infty$, $L_p[0, 1]$ contains $l_p^n$’s uniformly, thus Example 10(a), (aa) is a particular case of next example.

From [1, Exercise 8.18(a), p. 107] it follows that $L_\infty[0, 1]$ contains $l_1^n$’s uniformly, thus Example 10(b), (bb) is also a particular case of next example.

In the statement of the next example we will use the operator $J$ which occur in $(\ast)$.

**Example 15.** (a) Let $1 \leq p < \infty$, $X$ be a Banach space which contains $l_p^n$’s uniformly, $(\alpha_{ni})_{i,n}$ such that $\alpha \in l_\infty(l_p^n \mid n \in \mathbb{N})$ if $1 \leq p < 2$, or $\alpha \in l_\infty(l_p^n \mid n \in \mathbb{N})$ if $2 \leq p$. Let $U_\alpha : C[0, 1] \to c_0(X)$ be the operator defined by

$$U_\alpha(f) = \left(\text{Average} \left(\alpha_{ni}J(e_{ni}) \int_0^1 f(t) r_{n+i}(t) \, dt\right) \mid 1 \leq i \leq n\right)_{n \in \mathbb{N}}.$$ 

Then

(i) $U_\alpha$ is weakly compact.

(ii) $U_\alpha$ is compact if and only if $\alpha \in c_0(l_p^n \mid n \in \mathbb{N})$ if $1 \leq p < 2$, or $\alpha \in c_0(l_p^n \mid n \in \mathbb{N})$ if $2 \leq p$.

(iii) $U_\alpha$ is absolutely summing if and only if $\alpha \in l_\infty(l_p^n \mid n \in \mathbb{N})$.

(iv) $U_\alpha$ is nuclear if and only if $\alpha \in c_0(l_p^n \mid n \in \mathbb{N})$.

(b) Let $X$ be a Banach space which contains $l_p^n$’s uniformly, $(\alpha_{ni})_{i,n}$ such that $\alpha \in l_\infty(l_p^n \mid n \in \mathbb{N})$. Let $U_\alpha : C[0, 1] \to c_0(X)$ be the operator defined by

$$U_\alpha(f) = \left(\text{Average} \left(\alpha_{ni}J(e_{ni}) \int_0^1 f(t) r_{n+i}(t) \, dt\right) \mid 1 \leq i \leq n\right)_{n \in \mathbb{N}}.$$ 

Then

(i) $U_\alpha$ is absolutely summing.

(ii) $U_\alpha$ is compact if and only if $U_\alpha$ is nuclear if and only if $\alpha \in c_0(l_p^n \mid n \in \mathbb{N})$.

(c) Let $X$ be a Banach space which contains $l_p^n$’s uniformly, $(\alpha_{ni})_{i,j,n}$ such that $\beta \in l_\infty(l_p^n(l_2^p) \mid n \in \mathbb{N})$ and for each natural number $n$ denote

$$x_{ni} = \alpha_{n1i}J(e_{n1}) + \alpha_{n2i}J(e_{n2}) + \cdots + \alpha_{nin}J(e_{nn}).$$

Let $U_\beta : C[0, 1] \to c_0(X)$ be the operator defined by

$$U_\beta(f) = \left(\text{Average} \left(x_{ni} \int_0^1 f(t) r_{n+i}(t) \, dt\right) \mid 1 \leq i \leq n\right)_{n \in \mathbb{N}}.$$ 

Then

(i) $U_\beta$ is weakly compact.

(ii) $U_\beta$ is compact if and only if $\beta \in c_0(l_\infty(l_2^p) \mid n \in \mathbb{N})$.

(iii) $U_\beta$ is absolutely summing if and only if $\beta \in l_\infty(l_\infty(l_1^p) \mid n \in \mathbb{N})$. 

(iv) $U_{ij}$ is nuclear if and only if $\beta \in c_0 \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

(aa) Let $k \geq 2$ be a natural number, $1 \leq p < \infty$, $X$ a Banach space which contains $l^p_n$'s uniformly, $(\alpha_{ni})_{i,n}$ such that $\alpha_{mod} \in l_\infty \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

Let $U_\alpha : C[0,1] \rightarrow c_0 (X)$ be the operator defined by

$$U_\alpha (f) = \left( \text{Average}_k \left( \alpha_{ni} J (e_{ni}) \int_0^1 f (t) r_{n+1} (t) dt \right) \bigg| 1 \leq i \leq n \right)_{n \in \mathbb{N}}.$$

Then

(i) $U_\alpha$ is weakly compact.

(ii) $U_\alpha$ is compact if and only if $\alpha_{mod} \in c_0 \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

(iii) for $p \geq 2$, $U_\alpha$ is absolutely summing; for $1 \leq p < 2$, $U_\alpha$ is absolutely summing if and only if $\alpha_{mod} \in l_\infty \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

(iv) for $p \geq 2$, $U_\alpha$ is nuclear if and only if $U_\alpha$ is compact if and only if $\alpha_{mod} \in c_0 \left( L^p_\infty \big| n \in \mathbb{N} \right)$; for $1 \leq p < 2$, $U_\alpha$ is nuclear if and only if $\alpha_{mod} \in c_0 \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

(bb) Let $k \geq 2$ be a natural number, $X$ a Banach space which contains $l^p_n$'s uniformly, $(\alpha_{ni})_{i,n}$ such that $\alpha_{mod} \in l_\infty \left( L^p_\infty \big| n \in \mathbb{N} \right)$.

Let $U_\alpha : C[0,1] \rightarrow c_0 (X)$ be the operator defined by

$$U_\alpha (f) = \left( \text{Average}_k \left( \alpha_{ni} J (e_{ni}) \int_0^1 f (t) r_{n+1} (t) dt \right) \bigg| 1 \leq i \leq n \right)_{n \in \mathbb{N}}.$$

Then

(i) $U_\alpha$ is absolutely summing.

(ii) $U_\alpha$ is compact if and only if $U_\alpha$ is nuclear if and only if $\alpha_{mod} \in c_0 (L^p_\infty \big| n \in \mathbb{N} \right)$.

(cc) Let $k \geq 2$ be a natural number, $X$ a Banach space which contains $l^p_n$'s uniformly, $(\alpha_{ni})_{i,n}$ such that $\beta_{mod} \in l_\infty \left( L^p_\infty \big| n \in \mathbb{N} \right)$ and for each natural number $n$ denote

$$x_{ni} = \alpha_{ni1} J (e_{n1}) + \alpha_{ni2} J (e_{n2}) + \cdots + \alpha_{nin} J (e_{nn}).$$

Let $U_\beta : C[0,1] \rightarrow c_0 (X)$ be the operator defined by

$$U_\beta (f) = \left( \text{Average}_k \left( x_{ni} \int_0^1 f (t) r_{n+1} (t) dt \right) \bigg| 1 \leq i \leq n \right)_{n \in \mathbb{N}}.$$

Then

(i) $U_\beta$ is weakly compact.

(ii) $U_\beta$ is compact if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \big| n \in \mathbb{N} \right)$.

(iii) $U_\beta$ is absolutely summing if and only if $\beta_{mod} \in l_\infty \left( l^p_\infty \big| n \in \mathbb{N} \right)$.

(iv) $U_\beta$ is nuclear if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \big| n \in \mathbb{N} \right)$.

Proof. (a) From Corollary 7(a), $U_\alpha$ is weakly compact and further $U_\alpha$ is compact if and only if $w_2 (\alpha_{ni} J (e_{ni}) \big| 1 \leq i \leq n \rightarrow 0$; $U_\alpha$ is absolutely summing if and only if sup $w_1 (\alpha_{ni} J (e_{ni}) \big| 1 \leq i \leq n < \infty$; $U_\alpha$ is nuclear if and only if $w_1 (\alpha_{ni} J (e_{ni}) \big| 1 \leq i \leq n \rightarrow 0$. 

(b) Let $k \geq 2$ be a natural number, $X$ a Banach space which contains $l^p_n$'s uniformly, $(\alpha_{ni})_{i,n}$ such that $\beta_{mod} \in l_\infty \left( l^p_\infty \big| n \in \mathbb{N} \right)$ and for each natural number $n$ denote

$$x_{ni} = \alpha_{ni1} J (e_{n1}) + \alpha_{ni2} J (e_{n2}) + \cdots + \alpha_{nin} J (e_{nn}).$$

Let $U_\beta : C[0,1] \rightarrow c_0 (X)$ be the operator defined by

$$U_\beta (f) = \left( \text{Average}_k \left( x_{ni} \int_0^1 f (t) r_{n+1} (t) dt \right) \bigg| 1 \leq i \leq n \right)_{n \in \mathbb{N}}.$$

Then

(i) $U_\beta$ is weakly compact.

(ii) $U_\beta$ is compact if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \big| n \in \mathbb{N} \right)$.

(iii) $U_\beta$ is absolutely summing if and only if $\beta_{mod} \in l_\infty \left( l^p_\infty \big| n \in \mathbb{N} \right)$.

(iv) $U_\beta$ is nuclear if and only if $\beta_{mod} \in c_0 \left( l^p_\infty \big| n \in \mathbb{N} \right)$.
Let $(*)$ and Proposition 8(iii) and (iv) the statement follows.

(a) The proof is similar to that of (a) and use Corollary 7(b). We omit the details. The proofs of (b), (bb) and (c), (cc) are also similar to that of (a). We prove now (c).

From Corollary 7(a) $U_β$ is weakly compact and further $U_β$ is compact if and only if $w_2(ξ_i) \to 0$;

$U_β$ is absolutely summing if and only if $\sup_{n \in \mathbb{N}} w_1(ξ_i) < \infty$;

$U_β$ is nuclear if and only if $w_1(ξ_i) \to 0$.

From $(*)$ an Proposition 8(iii) and (v) we get the statement.

Since, by the famous Dvoretzky theorem, see [2, Chapter 19], each infinite dimensional Banach space contains $l^n_2$'s uniformly, i.e., $\forall ε > 0$, $\forall n \in \mathbb{N}$ there exists a bounded linear operator $J : l^n_2 \to X$ such that

$$\|ξ\|_2 \leq \|J(ξ)\|_X \leq (1 + ε)\|ξ\|_2, \forall ξ \in l^n_2$$

from Example 15(a), (aa) we get the next example; we use in the statement of this example the operator $J$ from $(**)$.

$$\Box$$

**Example 16.** Let $X$ be an infinite dimensional Banach space and $(α_n)_{i,n}$.  

(a) If $α \in l_∞(l^n_∞ | n \in \mathbb{N})$, let $U_α : C[0, 1] \to c_0(X)$ be the operator defined by

$$U_α(f) = \left(\text{Average}_{n} \left(α_{ni} J(ε_{ni}) \int_0^1 f(t) r_{n+1}(t) dt \right) | 1 \leq i \leq n\right)_{n \in \mathbb{N}}.$$  

Then

(i) $U_α$ is weakly compact.

(ii) $U_α$ is compact if and only if $α \in c_0(l^n_∞ | n \in \mathbb{N})$.

(iii) $U_α$ is absolutely summing if and only if $α \in l_∞(l^n_∞ | n \in \mathbb{N})$.

(iv) $U_α$ is nuclear if and only if $α \in c_0(l^n_∞ | n \in \mathbb{N})$.

(b) If $k \geq 2$ is a natural number and $α_{mod} \in l_∞(l^n_∞ | n \in \mathbb{N})$, let $U_α : C[0, 1] \to c_0(X)$ be the operator defined by

$$U_α(f) = \left(\text{Average}_{k} \left(α_{ni} J(ε_{ni}) \int_0^1 f(t) r_{n+1}(t) dt \right) | 1 \leq i \leq n\right)_{n \in \mathbb{N}}.$$  

Then

(i) $U_α$ is absolutely summing.

(ii) $U_α$ is nuclear if and only if $U_α$ is compact if and only if $α_{mod} \in c_0(l^n_∞ | n \in \mathbb{N})$.

The proof of the next example follows from Corollary 7 and Proposition 8(x), (xi).

**Example 17.** Let $(S_n, Ξ_n, ν_n)_{n \in \mathbb{N}}$ be a sequence of finite measure spaces.

(a) Let $(g_n)_{1 \leq i \leq n} \subset L_1(ν_n)$, $g_n = (g_{n1}, \ldots, g_{nn}) : S_n \to \mathbb{R}^n$ be such that

$$\sup_{n \in \mathbb{N}} \sup_{β \in l^n_2, ∥β∥_2 \leq 1} \int_{S_n} ∥M_β(g_n(s_n))∥_2 dv_ν(s_n) < \infty.$$

Let $U : C[0, 1] \rightarrow c_0 \left( L_1 \left( \lambda \otimes \nu_n \right) \mid n \in \mathbb{N} \right)$ be the operator defined by

\[ U(f) = \left( \text{Average} \left( r_{\alpha, g_{\alpha}} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n \right) ; L_1 \left( \lambda \otimes \nu_n \right) \right)_{n \in \mathbb{N}}. \]

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if

\[ \sup_{\beta \in l_2^\beta; \|\beta\|_2 \leq 1} \int_{S_\beta} \|M_{g_n}(s_n)\|_2 \, d\nu_n(s_n) \rightarrow 0. \]

(iii) $U$ is absolutely summing if and only if $\sup_{n \in \mathbb{N}} \int_{S_n} \|g_n(s_n)\|_2 \, d\nu_n(s_n) < \infty$. 

(iv) $U$ is nuclear if and only if $\int_{S_n} \|g_n(s_n)\|_2 \, d\nu_n(s_n) \rightarrow 0$.

(b) Let $(\alpha_{ni})_{i,n} \subset K$, $(E_{ni})_{1 \leq i \leq n} \subset \Sigma_n$ be a partition for $S_n$, 

\[ \beta_n = (\alpha_{n1}\nu_n(E_{n1}), \ldots, \alpha_{nn}\nu_n(E_{nn})), \beta = (\beta_n)_{n \in \mathbb{N}} \]

such that $\beta \in l_\infty \left( l_2^n \mid n \in \mathbb{N} \right)$.

Let $U : C[0, 1] \rightarrow c_0 \left( L_1 \left( \lambda \otimes \nu_n \right) \mid n \in \mathbb{N} \right)$ be the operator defined by

\[ U(f) = \left( \text{Average} \left( \alpha_{ni} r_{i, \chi_{E_{ni}}} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n \right) ; L_1 \left( \lambda \otimes \nu_n \right) \right)_{n \in \mathbb{N}}. \]

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if $\beta \in c_0 \left( l_2^n \mid n \in \mathbb{N} \right)$.

(iii) $U$ is absolutely summing if and only if $\beta \in l_\infty \left( l_1^n \mid n \in \mathbb{N} \right)$.

(iv) $U$ is nuclear if and only if $\beta \in \ell_1 \left( l_2^n \mid n \in \mathbb{N} \right)$.

(b) Let $k \geq 2$ be a natural number, $(\alpha_{ni})_{i,n} \subset K$, $(E_{ni})_{1 \leq i \leq n} \subset \Sigma_n$ be a partition for $S_n$, $\beta_n = (\alpha_{n1}\nu_n(E_{n1}), \ldots, \alpha_{nn}\nu_n(E_{nn}))$, $\beta \mod (\beta_{ni})_{n \in \mathbb{N}}$ such that $\beta_{ni} \in l_\infty \left( l_2^n \mid n \in \mathbb{N} \right)$.

Let $U : C[0, 1] \rightarrow c_0 \left( L_1 \left( \mu \otimes \nu_n \right) \mid n \in \mathbb{N} \right)$ be the operator defined by

\[ U(f) = \left( \text{Average} \left( \alpha_{ni} r_{i, \chi_{E_{ni}}} \int_0^1 f(t) r_{n+i}(t) \, dt \mid 1 \leq i \leq n \right) ; L_1 \left( \lambda \otimes \nu_n \right) \right)_{n \in \mathbb{N}}. \]

Then

(i) $U$ is weakly compact.

(ii) $U$ is compact if and only if $\beta_{ni} \in c_0 \left( l_2^n \mid n \in \mathbb{N} \right)$.

(iii) $U$ is absolutely summing if and only if $\beta_{ni} \in l_\infty \left( l_2^n \mid n \in \mathbb{N} \right)$.

(iv) $U$ is nuclear if and only if $\beta_{ni} \in \ell_1 \left( l_2^n \mid n \in \mathbb{N} \right)$.
