ABSTRACT

Sponges of the family Spongiiidae are poorly known in Korean waters. This paper describes Hippospongia bergquistia n. sp. of the family Spongiiidae (Demospongiae: Dictyoceratida) collected from Moselpo, Jejudo Island, Korea in 2007. This new species has a cavernous construction, rare pseudo-tertiary fibre, and rare primary fibres.

Keywords: new species, Hippospongia, Spongiiidae, Porifera, Korea

INTRODUCTION

The family Spongiiidae consists of six valid genera; Spongia, including three subgenera, S. (Spongia), S. (Australospongia), and S. (Heterofibria), Hippospongia, Coscinoderma, Hyatella, Leiosella, and Rhppaloeides. Important characteristics used to distinguish genera include surface armouring, skeletal morphology, and internal lacunae (Hooper and van Soest, 2002). The genus Hippospongia is characterized by the presence of a cavernous construction and rare primary fibres (Poléjaeff, 1884). There are only three valid species of Hippospongia worldwide: H. communis (Lamarck, 1814) and H. gossypina (Duchassaing de Fonbressin and Michelotti, 1864) from Europe and H. lachne (de Laubenfels, 1936) from the West Indies (Duchassaing de Fonbressin and Michelotti, 1864; Dendy, 1905, de Laubenfels, 1936; van Soest, 1978; Bergquist, 1980). Generic assignment of species, except for three valid species of Hippospongia, remains undetermined (Cook and Bergquist, 2001; Hooper and van Soest, 2002).

Hippospongia from Korean waters is reported for the first time. Sponge specimens were collected by SCUBA diving at a depth of 20-30 m at Moselpo, Jejudo Island, Korea. They were fixed in 95% methyl alcohol or absolute ethyl alcohol, and stored separately. The sponge surface and conules were observed under a stereomicroscope. The skeletal arrangement was studied under a light microscope and scanning electron microscope (S-3000N; Hitachi, Tokyo, Japan). The type specimens have been deposited at the Natural History Museum, Hannam University (HUNHM).

SYSTEMATIC ACCOUNTS

Phylum Porifera Grant, 1836
Class Demospongiae Sollas, 1885
Order Dictyoceratida Minchin, 1900
Family Spongiiidae Gray, 1867

¹*Hippospongia bergquistia n. sp. (Figs. 1, 2)

Type specimen. Holotype (Por. 105), Moselpo (Unjin Harbor), Jejudo Island, 28 Sep 2007, Mun SE, by SCUBA diving at 20-30 m in depth (HUNHM). Paratype (Por. 105-1), collected with Holotype (HUNHM).

Description. Upright with sub-cylindrical cavernous body. Size up to 8 × 13 cm high and 2-5 mm thick. Surface smooth and covered with thin transparent membrane pierced by numerous large and small pores. Top of body narrower than lower part. Numerous pores of variable diameter arranged in groups of 8-15. Texture, elastic but easily torn. Colour, ivory and pale purple in life. Large lacunae well developed through whole body.

Skeleton. Cored primary fibres, 30-60 μm in diameter, near surface but very simple and rare. Uncored secondary fibres,

20-60 μm in diameter, mainly forming polygonal mesh, 160-520 μm in diameter, just under sponge surface. Inside choanosome, irregular skeletal mesh. Pseudo-tertiary fibres, 8-12 μm in diameter, restricted to sponge base near primary fibres.

**Etymology.** This species is named for the late Dr. Patricia Bergquist, former professor at the University of Auckland, Auckland, New Zealand.

**Remarks.** This new species is distinguished from other hippospongian species by pseudo-tertiary fibres in the sponge.

base part. *Hippospongia communis* is extremely tough, as durable as leather, and has extremely rare primary fibres, 80 μm in diameter, and very thin fibres, 9-17 μm in diameter (Lamarck, 1814; de Laubenfels, 1954). *H. gossypina* has thicker primary fibres, 50-100 μm in diameter, and secondary fibres, 10-45 μm in diameter, compared with fibres of the

new species (Duchassaing de Fonbressin and Michelotti, 1864; van Soest, 1978). Fibres of *H. lachne* are approximately equal in diameter, around 30 μm (de Laubenfels, 1936, 1948).

**ACKNOWLEDGEMENTS**

This research was supported by a grant from the Marine Biotechnology Programme funded by the Ministry of Land, Transport and Maritime Affairs of the Korean Government. We thank Dr. G.J. Bakus, Department of Biological Science, University of Southern California, for his review of the manuscript.
